

SAY'S FIREFLY

- Fireflies are winged beetles, commonly called lightning bugs for their use of bioluminescence during twilight hours to attract mates or prey.
- A male firefly flashes a unique light pattern; an attracted female will reciprocate the same pattern.
- After mating, the female lays her fertilized eggs on or just below the surface of the ground. The eggs hatch three to four weeks later, and the larvae feed until the end of the summer.
- Firefly larvae are called glowworms.
- Most fireflies are distasteful to eat and can be poisonous to vertebrate predators.

Power: 110 VAC 60 Hz @ 2.1 Amps

Compressed Air: 1.5 CFM refrigerated (dry) @ 110 PSI

Weight: 500 lbs. (227 kg) (approx.)

Overall length: 6' (1.83 m), Length off the front: n/a, Length off the back: n/a
